

Quick Start - Fix Database Issue

The Problem

Your Mindous.ai database is **NOT working** because:

1. Supabase API key is truncated (incomplete)
2. Supabase project may be paused
3. Database migrations haven't been applied

The Fix (3 Simple Steps)

Step 1: Unpause Your Supabase Project (if needed)

1. Go to <https://supabase.com/dashboard>
2. Login with GitHub: **seanjtuckercm**
3. Find project: `ktorvduzhojsvakixvcr`
4. If you see "Resume" or "Restore" button → Click it
5. Wait 2-3 minutes for project to activate

Step 2: Get Your Credentials

In Supabase Dashboard:

- **Settings** → **API** → Copy these:
 - Project URL
 - anon/public key (FULL JWT token - don't truncate!)
 - service_role key (FULL JWT token)
- **Settings** → **Database** → Copy:
 - Connection String (URI format)

Step 3: Run the Fix

```
cd /home/ubuntu/mindous

# Update credentials interactively
./update-supabase-credentials.sh

# Apply fix and verify
./fix-database.sh
```

What Happens

The scripts will:

-  Update your `.env.local` with correct credentials
-  Test database connection
-  Apply all migrations
-  Create all 7 required tables
-  Verify everything works

Result

Database will be permanently fixed - no more connection errors!
